Lindhaus Introduces LW46 Hybrid Scrubber

The Lindhaus LW46 revolutionary floor cleaning scrubber has arrived. This latest innovation from Lindhaus was introduced to the world market in Italy at the Pulire 2011 trade show.

For over 25 years, Lindhaus has been distinguished by its quality products, including a full line of upright and canister vacuum cleaners as well as the popular LW30 and LW38 hard floor scrubbers.

According to the president of Lindhaus and creator of the LW46, Michele Massaro, the results of the new LW46 Hybrid have far exceeded any expectations.

Massaro goes on to state, "The idea was born four years ago; however, only in the last two years has the design and creation of the project come full circle. The LW46 is completely manufactured and fully tested in the Veneto region of Italy, making it a true 'Made in Italy' machine, something that makes us extremely proud."

The LW46 Hybrid Scrubber/Drier can be powered by battery or electric, a fact that makes it simple to use. Some of the top features of the LW46 are its extra wide 46-inch cleaning path, a highly efficient two-stage motor, high speed brush roller, easy to clean tanks and very low noise level.

The LW46 uses the latest ergonomic criteria to make it extremely comfortable and easy to maneuver. The LW46 also folds down for convenient portability and storage. Power and energy savings are guaranteed by the high efficiency two-stage vacuum motor.

See a demo of this new product in the Lindhaus booth #3613 at ISSA/INTERCLEAN in Las Vegas, NV. The event takes place October 18-21, 2011.

The LW46 can also be seen in action at: <http://www.youtube.com/watch?v=x96r1z0Sf0Q>.

Lindhaus Vacuum Cleaners Rated Best For Sand

Lindhaus upright vacuum cleaners are simply the best vacuum cleaners for sand, say distributors nationwide. Lindhaus manufactures the most complete line of dual motor upright vacuum cleaners, with on-board tools, available in 12-, 15-, 18- and 20-inch widths.

The inside story to the amazing performance of Lindhaus vacuum cleaners is their patented brush roll design. Each Lindhaus' brush roller features a 360-degree convergent brush. Simply put, each brush roll is patterned with bristles that spiral the entire circumference of the roller toward the center throat of the vacuum nozzle.

These brushes, which feature 20 percent more bristle than leading competitors, while revolving 40 percent faster than those of leading competitors, according to Lindhaus, act as a turbo charger. This patented design digs out deeply embedded sand and dirt, then propels it into the suction throat of the nozzle in a synchronized effort. This system cleans 27 percent faster than leading competitive models.

Commercial customers understand the value that good equipment can bring when cutting into labor expenses. The unique bristle pattern of the Lindhaus brush roller is hard hitting when it comes to performance, yet easy going when it comes to the carpets and fibers it cleans. The continuous contact pattern of polished bristles on the "dynamically balanced" core never strikes the fibers at harsh angles like so many other products with slide-in brush strips.

Replaceable brush strips must be configured at an aggressive angle to the carpet fibers in order to slide in and out, which results in unnecessary fiber wear. Some brush rollers feature one single removable strip that twirls the entire length of the brush roll in one direction. The result of this design is that the brush pushes debris in one direction only. Half of the brush will push debris toward the throat, while the other half is actually pushing debris away from that throat. End-users can tell of the unpredictability of this design in which all forms of tracked-in pea gravel and debris are spit out and thrown away from the nozzle.

The patented Lindhaus brush roller is so effective at gathering material it can even clean without the aid of suction. This is a feature that is often demonstrated by salesmen showing the Lindhaus vacuum cleaner to potential customers.

David Wesley, of Valley Supply, has his entire staff demonstrate this feature by dumping a pile of sand or salt onto the carpet. They remove the hose from the wand, then push the Lindhaus into the pile of debris with the hose still disconnected — thus the pile of debris is being cleaned by the brush only.

"When the customer sees that the pattern of the brush is digging out and

throwing all that sand up into the vacuum cleaner without any suction — it definitely impresses them," Wesley said. "They can even see it throwing the salt out the end of the wand some three feet off the ground."

When this energy is teamed up with the advanced performance of the dual fan Rotafil motor, which generates over 110 C.F.M., it's no wonder Lindhaus is rated "Best for Sand."

Along with the "Best for Sand" rating, an ever growing number of distributors are getting on board with the Lindwash upright hard floor scrubber/dryer. The Lindwash is the only full-featured auto-scrubber sized for ease of access. The Lindwash is manufactured with all of the qualities and performance of the large industrial scrubbers, but without the bulky design, heavy weight and difficult handling.

With this "vacuum cleaner-like" design and low 5.5-inch base height, the LW Pro scrubbers allow for easy access under low furniture. The inclination of the vertical suction body permits washing under tables of restaurants, and is small enough to navigate through the smallest commercial kitchen. The handle weight is a mere 2.8 pounds, lighter than most vacuum cleaners.

The Lindwash Pro is a two-motor system with patented user-friendly designs. Its independently-controlled switches will dispense a controlled amount of cleaning solution on the floor and scrub away all forms of greasy dirt and tough grime. With the push of a button, the Lindwash Pro will extract all the dirty water while rinsing and drying the floor instantly.

The Lindwash Pro incorporates a sophisticated electronic control which "soft starts" the brush motor and maintains perfect brush RPM. It also allows for perfect brush pressure and is protected by an overload sensor. The brush roll, which is available in three degrees of "stiffness," is kept uniformly wet by several injectors spraying directly into the brush. Other machines drop solution directly on the floor and drive their brush into the standing solution. This is why they require constant dumping and refilling.

The extraction is perfect in both directions thanks to the dual set of squeegees working simultaneously in front of, and behind, the brush. The brush roll and squeegees can be removed in seconds without tools for cleaning and maintenance. An optional hose and wands are available for upholstery, window and wall cleaning.
